Lab activity II – External Interrupts

Write modular program to implement and test FSM based model as per mentioned FSM diagram. FSM consists of below states.

Idle state;

Initial state or default state

Task: LED1, LED2 blinks continuously with 2 sec delay

Next state transition; State A

State A;

Triggered by interrupt from switch 1

Task; LED1, LED2 are ON

State B;

Triggered by interrupt from switch 2

Task: LED1, LED2 are OFF

Next State: idle state

Idle state;

Triggered by interrupt from switch 1 when system is in State B

Below Fig represents the transitions corresponding to various states.

The modular program consists of separate two .c files (GPIO.c and FSMState.c) and corresponding header .h file (GPIO.h and FSMState.h) as per below API;

GPIO.c functionality and related API's or functions:

GPIOConfig(Pin, mode)

Purpose: The function is used to configure the mode of the pin.

Pin: The Atmega328P port pin which need to be configured.

Mode: direction of the pin in INPUT or OUTPUT. In case of INPUT, the mode is required to be configured for PULLUP configuration along with INPUT.

GPIOWrite (pin, state)

Purpose: The function is used to write LOW or HIGH state to GPIO pin.

Pin: The Atmega328P pin used to write LOW or HIGH state.

State: LOW or HIGH

StateFSM.c functionality and related API's or functions:

FSMInit():

Purpose: The function is used to initialize the FSM transition to ideal state or default state.

Arguments: None

Return: None

FSMStateA():

Purpose: The function implements the task related to state A

Arguments: None

Return: None

FSMStateB():

Purpose: The function implements the task related to state B

Arguments: None

Return: None

Modular program guidelines:

.h files: This file contains
function prototype declarations
defined macro
extern variable declaration if any
typedef for variables

.c files: This file contains
Function definitions, variable definitions
Static functions declaration and definitions
Static variables, macros

The files need to be submitted in the zip folder having unique ID:

- Module Implementation files [.c files] and corresponding header files [.h files]
- Main program [.c file] to test as per problem statement and must have defined external Interrupt ISRs
- .HEX file
- Simulation circuit [.simu file]
